Control logic

Hamish Gibbs

Tutorial #1: Conditional logic

- Conditional execution
- Core concepts:
 - Booleans (True, False)

```
1 x = 5 == 5
```

Conditional execution

```
1 if x > 0:
2 print('x is positive')
```

Catching exceptions

```
1 try:
2  # Some code that throws an error
3 except:
4  # A useful error message
```

Conditional logic: R to Python

- The concept is the same, the Python syntax is simpler.
 - In Python, pay attention to your indentation!

R

```
1 if (x > 0) {
2    print('x is positive')
3 }
```

Python

```
1 if x > 0:
2 print('x is positive')
```

Tutorial #2: Iteration

- Iteration
- Core concepts:
 - Indefinite iteration (while)

```
1 while x < 10:
2  # Do something with x</pre>
```

Definite iteration (for)

```
1 for x in range(10):
2  print(x)
```

Iteration: R to Python

• Just like if statements, the R concept is the same, the Python syntax is simpler.

R

```
1 for (x in 1:3) {
2    print(x)
3 }
```

Python

```
1 for x in [1, 2, 3]:
2  print(x)
```

List comprehension

- Unique to Python: one-line iteration for lists.
 - Iterate over a list:

```
1 y = [x \text{ for } x \text{ in } [1, 2, 3]]
```

Manipulate each element of a list:

```
1 [x + 3 for x in y]
```

Tutorial #3: Iteration

- More control flow tools §4.1-4.6
- Core concepts:
 - The range() function

```
1 range(3)
```

- Other control statements (break, continue, pass)
- match statements

```
1 match point:
2    case 0:
3        print("x is 0")
4    case _:
5        print(f"x is anything else!")
```

Note: §4.6 mentions functions (def) which we will work
