Python data science

Hamish Gibbs

Recap

- Great job!
- We only have 4 days to go from introductory to advanced Python concepts.
 - Plus: programming tools like VSCode and git!
- Classes and functions can be abstract, but they are the building blocks of what we will do today.
 - Hopefully today is more familiar to people who have used R!

Today: Python data science

- Introduction to Python data science tools.
- Introduction to a basic data science workflow.
- This afternoon: collaborating on a data science project.

Tomorrow

- Data science "challenge"
- Predicting the nightly price of AirBnBs in London
- See the Guidelines here.

Data science

- Definition of data science:
 - "Extracting meaningful insights from data."
- *Meaningful* is important.
 - Use the tools of programming / statistics to create meaning from your data.
- Usually, there is no "right" answer, just "better" and "worse" answers.
 - You exercise a lot of judgement.

Data science workflow

- Data science is not just machine learning.
 - Most data science work is:
 - Data preparation
 - Data transformation
 - Method selection
 - Statistics / machine learning
 - Communicating results

Python data science tools

- Today, we will learn about the most popular Python data science "stack"
 - Data preparation / data transformation
 - pandas, numpy
 - Statistics / machine learning
 - sklearn
 - Communicating results
 - matplotlib

Python data science tools

- Tomorrow, we will use this "stack" to do our data science project
- Exploratory analysis, data transformation
 - pandas
- Regression model fitting and evaluation
 - sklearn
- Visualize results
 - pandas, matplotlib

R equivalents

- Python libraries mostly have their R equivalents:
 - pandas:dplyr
 - matplotlib:ggplot2
 - sklearn:caret?
- See what you prefer, I use both languages!

Diving deeper

- Python has many other options for data science tools.
- Alternatives to pandas:
 - polars (Like Python's version of data.table)
 - dask
- Alternatives to sklearn:
 - **.**..?
- Alternatives to matplotlib:
 - seaborn
 - plotnine (R users might like this one!)

Tutorial #1: Selecting data

- pandas-cookbook: Selecting data (Chapter 2)
- Core concepts:
 - Reading data from a .csv file
 - Inspecting a dataset
 - Selecting data

Tutorial #2: More selecting data

- pandas-cookbook: More selecting data (Chapter 3)
- Core concepts:
 - Selection by multiple columns
 - The role of numpy in pandas
 - Basic plotting (matplotlib in pandas)

Data: Tutorials 1 and 2

- Tutorials #1 and #2 come from the pandas-cookbook.
- Go to the /data folder in the GitHub repository (link above).
- Download the 311-service-requests.csv file and store it on your computer.

Packages: Tutorials 1 and 2

• Install the required packages using your terminal in VSCode

```
1 pip install pandas matplotlib scikit-learn
```

Trouble installing? Tell me!
